# CERTIFICATE

This is to certify that this thesis entitled STUDIES ON PHOTONIC BANDGAP BRAGG FIBERS AND WAVEGUIDES, being submitted by Ms. Sonali Dasgupta to the Indian Institute of Technology Delhi, is a record of bonafide research work carried out by her. She has worked under our guidance and supervision, and has fulfilled the requirements. which to our knowledge, have reached the requisite standard for the submission of this thesis. The results contained in this thesis have not been submitted in part or full to any other university or institute for the award of any degree or diploma.

Bishnu P. Pal

Professor of Physics

# ACKNOWLEDGEMENTS

The last four years of my research work has been an enjoyable and enriching journey for me, and I find great satisfaction in reaching my destination in the form of this thesis. During the the entire course of my Ph.D., I have been accompanied and supported by many people, and it is a pleasant aspect that I have now the opportunity to express my gratitude for all of them. It is indeed a formidable task to mention everyone who has directly and indirectly helped me during this period. However, I wish to express my sincere thanks to each one of them, even if I may be missing out on some names below.

Firstly, I would like to thank both of my supervisors, Prof. B. P. Pal and Prof. M. R. Shenoy, for their immense support and encouragement throughout the course of my research work. Their vast knowledge and vision were instrumental in the successful completion of my research endeavours. I could not have asked for a better advisor and mentor for my Ph.D. They taught me to look for solutions to problems (be it academic or otherwise) rather than focus on the problem. Besides being my advisor, Prof. Pal has also been a friend and guardian to me. I can never thank him enough for providing me with infinite support at times of my personal crisis. He has helped me grow as a person, not just as a researcher.

I consider myself fortunate to be a part of the Fiber Optics Group and I would like to express my warm and sincere thanks to all the faculty members of the group - Prof. Ajoy Ghatak, Late Prof. I. C. Goyal, Prof. K. Thyagarajan, Prof. Arun Kumar, Prof. Anurag Sharma, Prof. Ajit Kumar, Dr. B. D. Gupta and Dr. R. K. Varshney - for

their constant encouragement and help at various junctures during the course of my work. I cherish whatever little interaction I had with Prof. Ghatak, while working on one of the problems with him. I also enjoyed collaborating with Dr. Alexej Sysoliatin of the Russian Academy of Science, Moscow on the problem of solid-core Bragg fibers. I thank him sincerely for all the efforts in undertaking the fabrication of our proposed fiber designs.

I am indebted to my colleagues of the Fiber Optics Laboratory, Umesh, Prerana and Rohit, for providing me with a friendly environment, in which I could enjoy doing my research. I would like to specially thank my colleague and friend, Charu for giving me the much needed emotional support throughout my Ph.D. I would always remember the many thought provoking sessions and fruitful discussions we have had. I thank my colleagues of the Fiber Optics Group for creating a stimulating research environment. I also wish to thank Mr. K. Rajavinayagam for always being eager to help in every manner possible.

The financial support of the Council of Scientific and Industrial Research (CSIR), Government of India, for providing me with the Shyama Prasad Mukherjee Fellowship is gratefully acknowledged.

I owe a lot to my mother, father and sister, and my friends, for having faith in me and supporting me through all the ups and downs. Had it not been for my father, I would probably have been deprived of this wonderful experience of doing research. Finally, this thesis would not have been possible without the unconditional support and relentless encouragement of my friend, Srijon.

# Abstract

Optical fibers have revolutionized the field of telecommunications. High-speed optical networks have penetrated domains ranging from long-haul trans-oceanic networks to local access networks. Conventional optical fibers used in telecommunications comprise of a high-index doped silica core surrounded by a low-index silica cladding. Light is guided through the core by the phenomenon of total internal reflection. Photonic bandgap fibers are a special variety of optical fibers, which confine and guide light through the *photonic bandgap effect*. Bragg fibers belong to the category of one-dimensional photonic bandgap fibers. These fibers have lately attracted a great deal of interest owing to their potential to outperform the conventional silica fibers. This thesis deals with the design and analysis of Bragg fibers/waveguides and presents some novel designs for realizing high-performance components based on them for various applications.

In spite of the tremendous growth in data communication/Internet traffic, the last decade has witnessed a glut in the long-haul networks sector. This was a fallout of the over-capacity of installed fiber base under the ground than the actual requirement. However, the demand and bandwidth usage in metropolitan networks has been increasing significantly in the recent past. We propose for the first time in this thesis that Bragg fibers could prove to be an attractive transmission medium for the metro networks. Cost is one of the driving factors for these networks, which in turn necessitates the use of minimum number of components used in the network. The commercially available metro fibers typically provide a span length of  $\sim 100$  km, without the need for a dispersion compensator. However, they still require an amplifier

to compensate for the propagation loss. We exploit the low-loss feature of air-core Bragg fibers to overcome the need for amplifiers as well. We propose a Bragg fiber design that is optimized for metro applications and is capable of providing a span length of  $\sim 100$  km at 10 Gb/s, without the need for any dispersion compensator and amplifier.

Besides the fiber as the transmission medium, optical fiber networks comprise of a number of optical components, many of which are fiber-based, thereby enabling easy integration through splicing. Dispersion compensating fibers (DCFs) are one such integral component of any long-haul network. In this thesis, we propose the use of Bragg fibers for realizing ultra low-loss dispersion compensators. We present a novel Bragg fiber design for achieving highly efficient dispersion compensation. The figure of merit (which is a measure of efficiency) of the proposed dispersion compensator is almost two orders of magnitude higher than that of commercially available DCFs.

Apart from the air-core Bragg fibers, solid-core Bragg fibers also form an attractive alternative technology platform for realizing certain interesting optical devices. In this thesis, we propose for the first time, the use of solid-core Bragg fibers for nonlinear optical applications. We carry out a detailed theoretical study of nonlinear spectral broadening of a pulse propagating through solid-core Bragg fibers. Subsequently, we also propose generation of supercontinuum pulses, centered at the Nd-YAG wavelength (1064 nm), through the novel design of a dispersion-decreasing solid-core Bragg fiber.

The photonic bandgap effect has also been widely exploited to design planar low-loss waveguide-based devices, which are commonly referred to as Bragg reflection waveguides (BRWs). In all practical applications, these waveguides are of finite extent. However, the Bloch-wave formulation that is extensively used to study these waveguides inherently assumes an infinitely extended structure. In this thesis, we examine the validity and applicability of the Bloch-wave formulation to study some of the propagation characteristics (e.g. effective index and leakage loss) of the BRWs as obtained by the Bloch-wave formulation and those yielded by a matrix method based on leaky mode analysis. We show that the structural finiteness of the BRWs spawns

a difference in the values of the effective indices as compared to that of the infinitely-extended BRWs. We also show that the proposed method can be applied to analyze all symmetric BRW designs as well as chirped BRWs.
